E. Use of ":" 

The colon (2nd/period) allows you to enter more than one command on a line. The commands are separated by :. For example,

\[ x = 3 : y = 4 : x^2 + y^2 \]

returns 25. The sequence of commands

\[ y_1 = \tan x : \text{ZTrig} : \text{DispG} \]

will store \( \tan x \) in \( y_1 \), set the range settings to \( \text{ZTrig} \), and display the graph.
