F. Catalog

The CATALOG (2nd/CUSTOM) is a list of all commands, variable names, built-in functions, etc. For example, if you didn't know where the factorial symbol was found (it's on the MATH/PROB menu), you could waste a lot of time looking for it. Just go to the CATALOG and scroll up until you find it. The absolute value function (abs) is on the MATH/NUM menu but it is more easily accessed from the CATALOG; it is the first entry. In the last example in E above, the commands ZTrig and DispG were obtained from the CATALOG.

If you are on the CATALOG screen, pressing a letter will take you to the beginning of the listings which begin with that letter. Symbols (and commands which are preceded by the • symbol) are at the end of the list. If you are at the beginning of the listings, scrolling up will take you to the end of the listings.
